

ABSTRACT OF THE DISCLOSURE

A television picture or image enhancing system comprised of an apparatus and method for varying the vision prescription through which television pictures or images are perceived. The apparatus may be attached to or about a television or may be located about a television. The television pictures or images may be enhanced by television picture or image vision prescription signal manipulation. The vision prescription enhanced pictures or images produced per the present invention may be more clearly perceived by non-20/20 or poor vision viewers than the non-vision prescription enhanced picture or image received from present televisions.
